variant

```
The invention describes a recombinant human granulocyte colony-

stimulating factor (hG-CSF)-L-vFc fusion protein comprising hG-CSF, a

peptide linker, and a human immunoglobulin G (IGG) Fc variant. Also

described are: a CHO-derived cell line producing the above hG-CSF-L-vFc

fusion protein in its growth medium in excess of 10 £mgr;g per million

cells in a 24-hour period; and making the recombinant fusion protein

cited above, comprising generating a CHO-derived cell line cited above,

growing the cell line under conditions the recombinant fusion protein is

expressed in its growth medium, and purifying the expressed protein. The

recombinant fusion protein is useful in treating a variety of conditions

associated with an impaired immune or haemacopoietic system, including

cancer chemotherapy, leukaemias, anaemias, AIDS, bone marrow

transplantation, and chronic neutropenias. This is the amino acid

sequence of human GCSF-L-fragment of crystallisation gamma 2 variant
                                                                                                                                                                                                                                                                                                                                                                                             ö

gamma-2, with the variable region of the murine monoclonal antibody 128.1. This plasmid encodes a chimeric monoclonal antibody in which the heavy chain (VH) is derived from a murine source and the sequences encoding CHI. Git and CH3 are derived from a human source. This vector, in combination with the chimeric light chain vector, pAG4611 (see also AAQ43345), was transfected into SP2/0 cells and clones were isolated. 128.1 is an anti-human transferrin receptor antibody which binds to the transferrin receptor on brain capillary endothelial cells. This antibody may be used in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent neurological disorders eg. brain tumours, AIDS, stroke, epilepsy, Parkinsons and Alzheimers disease. It may also be used for diagnostic methods. (Updated on 25-MAR-2003 to correct PN field.)

dependent lyais, or the cell-mediated destruction of the target comprises: (a) a binding domain capable of binding a target molecule; and (b) an effector domain that is homologous to all or part of a constant domain of a human immunoglobulin (G [160] heavy chain. The binding molecule is used to bind a target molecule (especially FegammaRID causing inhibition of B cell activation, mast cell degranulation or phagocytosis). The binding molecule can be used to prevent or inhibit the binding molecule is useful for the treatment of graft-vs-binding of a second binding molecule is useful for the treatment of graft-vs-binding of a second binding molecule is useful for the treatment of graft-vs-binding of a second binding molecule is useful for the treatment of captured by the binding molecule is useful for the treatment of graft-vs-binding of a second binding molecule is useful for the treatment of captured captured by a second binding molecule is useful for the treatment of graft-vs-binding molecule is useful for the treatment of graft-vs-cautoimmune thrombocytopaenia, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, asthma and allergy), cetal/neonatal alloimmune thrombocytopaenia, asthma and allergy), cetal/neonatal alloimmune thrombocytopaenia, sickle cell anaemia and corronary artery occlusion). The binding molecules do not activate complement or trigger cytocoxic activities through FegammaR and desirable indenned maino acids, and are therefore likely to have reduced immunogenicity. Further, they still bind Protein A, which is consistent being able to cross the human placenta through interaction with FeRn being able to cross the human placenta through interaction with FeRn being able to cross the human placenta through interaction with FeRn being able to cross the human placenta through interaction with FeRn being able to cross the human placent a through interaction with FeRn being able to cross the human placent a through interaction with FeRn being able to cross the manner and placent and the protein
    capable of binding a target molecule without triggering complement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (neonatal Fc receptor)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 109 AA;

New Fc region-containing polypeptides that have altered effector function due to one or more amino acid modifications in the Fc region, useful in the treatment of cancer and allergic conditions such as asthma.

Disclosure; Fig 22A; 132pp; English

produce Fc region-containing polypeptides that have altered effector function as a consequence of one or more amino acid modifications in the Fc region. The variant polypeptides are useful for treating cancer, allergic conditions such as asthma (with an anti-lgE antibody), and LFA-mediated disorders. Where the polypeptide binds the HER2 receptor, the disorder preferably is HER2-expressing cancer, e.g. a benign or malignant tumour characterized by overexpressing cancer, e.g. a benign or malignant tumour characterized by overexpression of the HER2 receptor. Such cancers include breast cancer, gquamous cell cancer, small-cell lung cancer, non-small cell lung cancer, qastrointestinal cancer, pancreatic cancer, hepatoma, colon cancer, liver cancer, bladder cancer, hepatoma, carcinoma, kidney cancer, liver cancer, prostate cancer, vulval cancer, thyroid cancer, hepatic carcinoma and various types of head and neck The proteins are used to AAB07474-78 represent native IgG Fc regions. cancer

Non-naturally occurring peptide ligands which compete for binding human erB2 gene products, useful for treating e.g. Alzheimer's disease, multiple sclerosis and diabetic neuropathy.

Disclosure, Fig 2A, 116pp, English.

This invention relates to non-naturally occurring peptide ligands which bind to the human erbb2 gene product Erbb2 (also known as HER2). Peptides represented in AAB76350 - AAB76420 and AAB76432 - AAB76509 are examples of the Erbb2 binding ligands of the invention. Sequences AAB76421 -

AAB76431 represent antibody Fc amino acid sequences used in the isolation of the peptides of the invention. The peptides compete for binding ErbB2 with naturally occurring ligands, and may be used to treat disorders characterized by over expression of HER2/ErbB2 such as cancers, diseases of the nervous system musculature and epithelia, e.g. nervous system damage resulting from trauma, surgery, strokes, ischaemia, infection, metabolic disorders, nutritional deficiency or toxic agents. In partitular the synthetic peptide ligands may be used to treat Alzheimer's disease, Parkinson's disease, epilepsy, multiple sclerosis, Huntington's chorea, Down's syndrome, nerve deafness, Meniere's disease and neuropathy associated with diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a fusion protein, comprising a peptide ligand and an immunoglobulin (Ig) constant region multimerization domain (Ib). The hybrid molecules comprising the peptide ligands and their functional derivatives can be used in the same applications as, a peptide ligand can be used. For example the peptide ligand can bind ErbB2. The peptide ligand may bind to and inhibit the activity associated with a

This invention relates to an isolated antibody comprising a dimerisation domain and three or more antigen binding sites amino-terminal to the domain. It is extostatic, antilinflammatory, antibacterial, immunosuppressive, antiallergic, an apoptosis inducer, a vaccine and used isorder e.g. cancer in a mammal, for inducing apoptosis of a cancer in gene therapy. Along with a cytotoxic agent, is useful for treating a call, and for killing a B ell or a cell which overexpresses or expresses on ExbB receptor and for treating benign and malignant tumours, inflammatory, angiogenic and immunological disorders. The antibody is also useful for immunodiagnosis of various diseases including cancer, for human therapy in redirected cytotoxicity, and also useful as fibrinolytic agents or vaccine adjuvants, useful as affinity purification agent, in diagnostic assays for detecting the expression of antigen of interest in specific cells, tissue or serum, and useful for blocking an immune response to a foreign antigen. The antigen is internalised faster than a bivalent antibody comprises three or four heavy chain variable domains which are able to combine with three or four heavy chain variable domains polypeptides to form three or four antigen directed against the same antigen. This sequence represents the native sequence human IgG

About 80-1004 of the glycoprotein comprises a mature core carbohydrate structure which lacks fucose attached to the Fc region. The glycoprotein preferably comprises an antibody, and the Fc region is preferably a human IgG Fc region is preferably a human IgG Fc region is preferably a human IgG Fc region is preferably a human IgG Fc region is preferably a human IgG. Proporties of the from the following fucose. The antibody may be chimeric, humanised or human and binds a B-cell surface marker, an ErbB receptor, a tumourassociated antigen or an angiogenic factor, CD20, HER2, vascular endothelial growth factor. CD40 or prostate stem cell antigen. The composition is useful for treating cancer, autoimmune disease, an inflammatory disorder or infection in a mammal

```
The invention relates to a new composition comprises a variant of a parent polypeptide having at least a portion of a Fc region. The variant mediates antibody-dependent cell-mediated cytotoxicity (ADCC) in the presence of effector cells more effectively than the parent polypeptide and comprises at least one amino acid modification at position 280 in the accomposition is useful in treating diseases e.g., autoimmune diseases. The present sequence represents the amino acid sequence of a human immunoglobulin G, 1gG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a fusion protein, which comprises essentially of an immunoglobulin molecule (19 e.g. 1961 Fc or 1962 FC) or tisk fragment and a non-immunoglobulin molecule. The non-immunoglobulin molecule is a protein having the biological activity of glucocerebrosidase (GCR-like protein). Also included are a DNA sequence encoding the fusion protein comprising: (a) a signal/leader sequence. (b) an 19 molecule; or (c) a target protein sequence having the biological activity of GCR. Also crarget protein sequence having the biological activity of GCR. Also included are an expression vector comprising the fusion protein DNA, a host cell for expression the novel fusion protein and comprising the composition comprising the novel fusion protein and at least one pharmaceutical carrier, diluent or excipient. The fusion protein is useful for treating glycolipid storage disorders, specifically Gaucher's disease. Pabry's disease or Tay-Sachs disease. The fusion protein is also useful for the manufacture of a pharmaceutical composition for treating these diseases. The present sequence represents the Human mature 1962 Fc component suitable for inclusion in a fusion protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New fusion proteins with glucocerebrosidase activity, useful for treating glycolipid storage disorders, specifically Gaucher's disease, Fabry's disease or Tay-Sachs disease.
                                                                                                                Human, glucocerebrosidase, GCR, fusion protein, 1gG1, 1gG2, Fc, glycolipid storage disorder, Gaucher's disease, Fabry's disease, Tay-Sachs disease, nephrotropic, antilipemic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      98.6%; Score 572; DB 5; Length 228; 98.2%; Pred. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

$31866
Ig gamma-1 chain C region - synthetic
C;Species: synthetic
A;Note: Homo sapiens (man) gene engineered and expressed in Escherichia coli
C;Date: 06-Jan-1995 #sequence_revision 17-Mar-1997 #text_change 19-May-2000
C;Accession: $31866
R;Filpula, D.
submitted to the EMBL Data Library, February 1993
A;Description: Screeing method for protein-protein interactions of cloned gene products.
A;Reference number: $31866
A;Accession: $31866

A,Title: Primary structure of human gamma3 immunoglobulin deletion mutant: gamma3 heavy-A,Reference number: A90442, MUID:81021548; PMID:6774747
A,Contents: heavy chain disease protein Wis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A, Molecule type: protein
A, Residues: 1-289 FRA>
A, Note: the molecule is a dimer linked by 12 disulfide bonds; it has an extra interchain
A, Note: this protein lacks most of the V region and all of the CH1 region. Residue 12 co
A, Note: the sequence of residues 42-76 was taken from the reference that follows
R, Michaelsen, T.E.; Frangione, B.; Franklin, E.C.
A, Title: Primary structure of the 'hinge' region of human IgG3. Probable quadruplication
A, Reference number: A92219; MUID: 77118561; PMID: 402263
A, Contents: normal gamma-3 chains, sequence corresponding to residues 12-97 of protein W
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A; Molecule type: protein A; Residues: 12-97 < MIC> A; Rosidues: the hinge region in gamma-3 chains is about four times as long as in other gammalique segment (12-28)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     69, and 72 form inter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A,Molecule type: protein

Blochemistry 20:2261-2270(1981).
-! MISCELLANBOUS: Nie has the GIM(17) allotypic marker, 97-K, and the GIM(1) markers and the GIM (100-1) markers.
-! MISCELLANBOUS: Nie also differs in the amidation states of 35, 116, 198, 269 and 272.
-! MISCELLANBOUS: EU also differs in the amidation states of residues 155, 166, 177, 195, 198, 269, and 272 and in the order of residues 268-272.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SEQUENCE (MYELOMA PROTEIN NIE).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                          Sequence 27, Application US/09968362A

Sequence 27, Application US/09968362A

Patent No. 679743

GENERAL INFORMATION:
APPLICANT: Sun, Lee-Hwei K

APPLICANT: Sun, Bill
APPLICANT: Sun, Cecily R

TITLE OF INVENTION: For fusion proteins of human granulocyte colony-stimulaing factor TITLE OF INVENTION: increased biological activities
FILE REFERENCE: 03SUN2001

CURRENT APPLICATION NUMBER: US/09/968,362A

CURRENT FILING DATE: 2001-10-01

NUMBER OF SEQ ID NOS: 28

SOFTWARE: PatentIn version 3.1

SEQ ID NO 27

LENGTH: 228
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GENERAL INFORMATION:

Sequence 2, Application US/09766995

Patent No. 6737267

GRNERAL INFORMATION:

GRNERAL INFORMATION:

GRNERAL INFORMATION:

TITLE OF INVENTION: NON-PEPTINYL MOIETY-CONJUGATED CD4-GAMMA2 AND CD4-IgG2 IMMUNOCONJ

TITLE OF INVENTION: AND USES THEREOF

FILE REPERENCE: 20404/1215-CG4/DFW/SHS

CURRENT APPLICATION NUMBER: US/09/766,995

CURRENT FILING DATE: 2001-01-22

NUMBER OF SEQ ID NOS: 9

SOFTWARE: PATENTIN Version 3.0

SEQ ID NO 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GENERAL INFORMATION:

Antibody conjugates specific for transferrin receptor - used for diagnosis and treatment of cancer, AIDS and neurological disorders.

Disclosure; Fig 17J; 151pp; English.

The sequences given in AAR41707-09 are encoded by the expression vector pAH4625. This vector represents the cloning of the human gamma isotype, gamma-2, with the variable region of the murine monoclonal antibody 128.1. This plasmid encodes a chimeric monoclonal antibody in which the heavy chain (VH) is derived from a murine source and the sequences encoding CHL, CH2 and CH3 are derived from a human source. This vector, in combination with the chimeric light chain vector, pAG4611 (see also AAQ43845), was transfected into SP2/0 cells and clones were isolated.

```
This sequence represents the mutated CH2 molecule G2deltaa, and is a binding molecule of the invention. The recombinant binding molecule is capable of binding a target molecule without triggering complement dependent lysis, or the cell-mediated destruction of the target comprises: (a) a binding domain capable of binding a target molecule; and (b) an effector domain that is homologous to all or part of a constant domain of a human immunoglobulin G [IGS) heavy chain. The binding molecule is used to bind a target molecule (especially FcgammaRIIb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Binding molecule; CH2 sequence; complement dependent lysis; FcgammaRIIb; cell-mediated destruction; human; immunoglobulin G; IgG heavy chain; B cell activation; mast cell degranulation; phagocytosis; vasculitis; Crohn's disease; graft-va-host disease; organ transplant rejection; bone-marrow transplant rejection; autoimmune disease; asthma; allergy; alloimmune disorder; autoimmune haemolytic anaemia; inflammatory disease; autoimmune thrombocytopaenia; arthritis; erythroblastosis foetalis; encondata alloimmune thrombocytopaenia; docodpastures disease; therapy; sickle cell anaemia; coronary artery occlusion.
128.1 is an anti-human transferrin receptor antibody which binds to the transferrin receptor on brain capillary endothelial cells. This antibody may be used in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent eneurological disorders eg. brain tumours, AIDS, stroke, epilepsy, Parkinsons and Alzheimers disease. It may also be used for diagnostic methods. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                             9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immunoglobulic-derived binding molecules that do not activate complement or trigger cytotoxic activities and maintaining desirable immunoglobulin

causing inhibition of B cell activation, mast cell degranulation or phagocytosis). The binding molecule can be used to prevent or inhibit the binding of a second binding molecule, e.g. an antibody, to the target molecule. The binding molecule is useful for the treatment of graft-vg-host disease, organ transplant rejection, bone-marrow transplant cautoimmune thrombocytopaenia and arthritis), alloimmunity (e.g. tarcingmunity (e.g. tarcingmune thrombocytopaenia and arthritis), alloimmunity (e.g. total/neonatal alloimmune thrombocytopaenia, asthma and allergy), chronic or acute inflammatory diseases (e.g. Crohn's, HDN chromstal alloimmune thrombocytopaenia, asthma and allergy), chronic or acute inflammatory diseases (e.g. Crohn's, HDN chromary artery occlusion). The binding molecules do not activate complement or trigger cytotoxic activities through RegammaR and desirable complement or trigger cytotoxic activities through RegammaR and desirable immunogenicity. Further, they still bind Protein A, which is consistent immunogenicity. Further, they still bind Protein A, which is consistent with being able to cross the human placenta through interaction with FCRn

                        This sequence represents the mutated CH2 molecule Gideltaab, and is a binding molecule of the invention. The recombinant binding molecule is capable of binding a target molecule without triggering complement dependent lysis, or the cell-mediated destruction of the target comprises: (a) a binding domain capable of binding a target molecule; and (CD) an effector domain that is homologous to all or part of a constant domain of a human immunoglobulin G (IgG) heavy chain. The binding molecule is used to bind a target molecule (especially FegammaRIIb causing inhibition of B cell activation, mast cell degranulation or phagocytosis). The binding molecule can be used to prevent or inhibit the binding molecule can be used to prevent or inhibit the binding molecule is useful for the transplant rejection, autoimmune thrombocytopaenia and arthritis, autoimmune harmolytic anaemia, catoimmune thrombocytopaenia and arthritis), alloimmunity (e.g. vaculitis, autoimmunity (e.g. catoing and arthritis), alloimmunity (e.g. corplement or trigger cytotoxic activities through Fegamma and allergy), corporary artery occlusion). The binding molecules do not activate complement or trigger cytotoxic activities through Fegamma and corporation acids, and are therefore likely to have reduced immunogenicity. Further, they still bind Protein A, which is consistent immunogenically and are therefore likely to have reduced immunogenically alloids, and are therefore likely to have reduced immunogenically alloids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

This sequence represents the mutated CH2 molecule Gldeltaac, and is a binding molecule of the invention. The recombinant binding molecule is capable of binding a target molecule without tringering complement dependent lysis, or the cell-mediated destruction of the target comprises: (a) a binding domain capable of binding a target molecule; and (CD) an effector domain that is homologous to all or part of a constant combined in the comprises: (b) an effector domain that is homologous to all or part of a constant combined in the comprises of B cell activation, mast cell degranulation or phagocytosis). The binding molecule of second binding molecule, e.g. an antibody, to the target complexity of a second binding molecule, e.g. an antibody, to the target complexity of a second binding molecule, e.g. an antibody to the target complexity of a second binding molecule, a such meaning to the target of graft-vs. The binding molecule is useful for the treatment of graft-vs. The binding molecule is useful for the treatment of graft-vs. The control molecule and arthritis, alloimmunity (e.g. autoimmune thrombocytopaenia and arthritis), alloimmunity (e.g. autoimmune thrombocytopaenia and arthritis), alloimmunity (e.g. chronic or acute inflammatory diseases (e.g. Crohn's HDN corronary artery occlusion). The binding molecules do not activate complement or trigger cytotoxic activities through FogammaR and desirable thouse main amino acids, and are therefore likely to have reduced immunogenicity. Further, they still bind Portein A, which is consistent immunogenicity. Further, they still bind Portein A, which is consistent with being able to cross the human placenta through interaction with FCRn contracts.
                                                                                                                                                                                                Immunoglobulic-derived binding molecules that do not activate complement or trigger cytotoxic activities and maintaining desirable immunoglobulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          29

The sequences given in AAR41715-18 are encoded by the expression vector pAH4808. This vector represents the cloning of the human gamma isotype, gamma 4, with the variable region of the murine monoclonal antibody camma isotype, campoint the the variable region of the murine monoclonal antibody in which the eavy chain (VH) is derived from a murine source and the sequences encoding CHI, CH2 and CH3 are derived from a human source. This vector, in combination with the chimeric light chain vector, pAG4611 (see also AQ43845), was transfected into SD2/0 cells and clones were isolated. Is an anti-human transferrin receptor antibody which binds to the transferrin receptor on brain capillary endothelial cells. This antibody may be used in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent neurological disorders eg. brain tumours, AIDS, stroke, epilepsy, Parkinsons and Alzheimers disease. It may also be used for diagnostic methods. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Binding domain; immunoglobulin; fusion protein; cytostatic; antiatrbritic; immunosuppressive; antidiabetic; antithyroid; neuroprotective; hinge region; immunoglobulin heavy chain; CH2 constant region; Immunoglobulin heavy chain; antibody dependent cell-mediated cytotoxicity; ADCC; complement fixation; antibody dependent coll-mediated cytotoxicity; ADCC; complement fixation; antigon; exercinoma; sarcoma; rheumatoid archritis; myasthenia gravis; Grave's disease; type I diabetes mellitus; multiple sclerosis; autoimmune disease.

                                                                                                                                                                                                                                                                                                                                                                                                                      The anti-human CD3 mouse monoclonal antibody OKT3 (IgG2a) has potent T-cell activating and immunosuppressive activity, and is used to treat transplant patients to prevent rejection. The antibody can be engineered to contain a human Fc region. By transferring the binding specificity into a human framework, the immunogenicity is reduced without affecting the immunosuppressive activity. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polymerase chain reaction; primer; PCR; amplify; murine; pAH4625; heavy; light; chain; variable; constant; region; anti-human; pAH4807; transferrin; receptor; antibody; brain; capillary; pAH4808; gamma-2; endothelial cell; conjugate; neuropharmaceutical; gamma-3; gamma-4; diagnostic; agent; tumour; AlbS; stroke; epilepsy; monoclonal; Parkinsons disease; Alzheimers disease; SP2/0 cell.
                                                                                                                                                                                                                                                                     New humanised OKT3 antibody with mutated Fc receptor binding region - useful as immunosuppressant to reduce transplant rejection, lacks the T-cell activating side effects of wild type antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               63

In humans, IgG1 may exist as either of two allotypes at site 1, 2 or 17. The inventor's propose eliminating these allotypes by amino acid changes to agree with the sequences of IgG2, IgG3 and IgG4. None of the allotype sites (1, 2 and 17) are located within the CH2 domain. New "isoallotypes" should be suitable for therapeutic use in all patients. See AAR27678-R27681. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Humanised antibodies having modified allotypic determinant - useful for matching allotypes in therapy with decreased likelihood of causing undesirable immune responses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polymerase chain reaction; primer; PCR; amplify; murine; heavy; light; chain; variable; constant; region; anti-human; transferrin; receptor; antibody; brain; capillary; endothelial cell; conjugate; neuropharmaceutical; diagnostic; agent; tumour; AIDS; stroke; epilepsy; Parkinsons disease; Alzheimers disease.

                                                                                                                                                                           The invention relates to a binding domain-immunoglobulin fusion protein comprising a binding domain polypeptide, an immunoglobulin heavy chain Comperising a binding region polypeptide, an immunoglobulin heavy chain CCC immunoglobulin heavy chain CH2 constant region polypeptide, and an immunoglobulin heavy chain CH3 constant region polypeptide, and an immunoglobulin heavy chain CH3 constant region polypeptide that is fused to the CH2 constant region polypeptide. The hinge region polypeptide comprises: a wild-type human IgG1 immunoglobulin hinge region polypeptide comprises: a wild-type human IgG1 immunoglobulin hinge region polypeptide comprises, where the mutated human IgG1 immunoglobulin hinge region polypeptide companies, where the mutated human IgG1 immunoglobulin hinge region polypeptide contains of contains 3 or more cysteine residues, where the mutated human IgG1 immunoglobulin hinge region polypeptide contains to polypeptide contains of a least one of the mutated human IgG1 immunoglobulin hinge region polypeptide contains of cysteine residues. The binding domain immunoglobulin hinge region polypeptide contains of cysteine residues. The binding domain immunoglobulin hinge region polypeptide contains or cysteine residues. The binding domain immunoglobulin hinge region polypeptide contains or cysteine residues. The binding domain immunoglobulin hinge region polypeptide contains or cysteine residues. The binding domain immunoglobulin hinge region polypeptide contains or construct. Compisated the polymclectide (operably linked to a pronocent construct compisate the polymclectide opymerising the binding domain-immunoglobulin fusion protein, a recombinant expression construct. Producing the binding domain-immunoglobulin fusion protein or polymclectide and a carrier, and treating a subject having or suspected of having a mailgannt condition or a B-cell disorder, e.g. malanoma, carrier, and rearting a mailgannt condition or a B-cell disorder, e.g. malanoma, carrier, and carrier, and restring sequence of the seque
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   4 VAGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVQFNWYVDGVEVHNAKTKPREE 63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                4 LGGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVKFNWYVDGVEVHNAKTKPREE 63
                                          New binding domain-immunoglobulin fusion protein, useful for treating a subject having or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, Grave's disease or autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            90.2%; Score 523; DB 7; Length 109; 90.6%; Pred. The invention relates to a new composition comprises a variant of a parent polypeptide having at least a portion of a FC region. The variant mediates antibody-dependent cell-mediated cytotoxicity (ADCC) in the presence of effector cells more effectively than the parent polypeptide and comprises at least one amino acid medification at position 280 in the Ex region. The composition is useful in treating diseases e.g., autoimmune diseases. The present sequence represents the amino acid sequence of a human immunoglobulin G, IgG, CH region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CH1 deleted mimetibody; osteopathic; cardiovascular-Gen; dermatological-Gen; auditory; endocrine-Gen; gastrointestinal-Gen; gynaecological-Gen; auditory; endocrine-Gen; gastrointestinal-Gen; gynaecological-Gen; hepatotropic; haemostatic; immunomodulator; antiallergic; muscular-Gen; cytocataic; antiinflammatory; neuroleptic; ophthalmological; nephrotropic; respiratory-Gen; tumour necrosis factor TNF; cytokine; bone disorder; joint disorder; cardiovascular disorder; nose disorder; oral disorder; dermatological disorder; endocrine disorder; metabolic disorder; gastrointestinal disorder; endocrine disorder; hepatic disorder; obstetric disorder; haematologic disorder; mumunological disorder; allergic disorder; infectious disorder; musculoskeletal disorder; oncological disorder; neurological disorder; neurological disorder; popthalmologic disorder; pediatric disorder; pediatric disorder; pediatric disorder; pediatric disorder; popthalmologic disorder; pediatric disorder; psychiatric disorder;
